

MAVEN TOYS' STORE & PRODUCT PERFORMANCE DASHBOARD

by Lucila Aldana Quiñonez | Marketing Data Analyst

Business Problem

Maven Toys is a toy store chain with multiple retail locations across Mexico. The leadership team needs a simple and interactive dashboard to monitor key business metrics and identify high-level trends across stores and product categories.

The marketing data analyst is tasked with creating this dashboard using historical transactional data, spanning from January 2022 to September 2023. The available dataset includes sales transactions, product information, and store location details.

The goal of the report is to help executives quickly assess overall business health, evaluate store and product performance, and make informed decisions based on trends and KPIs.

Key Business Questions

Revenue & Sales Trends

- How are total sales evolving over time (monthly/quarterly)?
- Are there any clear seasonal patterns in sales?
- What are the peak and low-performing months?

Store Performance

- Which stores generate the highest revenue and number of transactions?
- How does each store perform relative to others over time?
- Are there underperforming locations that require attention?

Product Performance

- Which product categories and individual products are top-sellers?
- Which categories are growing or declining in popularity?

Customer Behavior

- What is the average transaction value (ticket size)?
- Are there any patterns in purchase behavior by region?

Operational Efficiency

- Are there stores or product categories with unusually high or low margins?

Dataset Overview

The dataset includes the following variables:

- Calendar: with the dates
- Data Dictionary:
 - Table
 - Field
 - Description
- Inventory:
 - Store ID
 - Product ID
 - Stock On Hand
- Products:
 - Product ID
 - Product Name
 - Product Category
 - Product Cost
 - Product Price
- Sales:
 - Sales ID
 - Date
 - Store ID
 - Product ID
 - Units
- Stores:
 - Store ID
 - Store Name
 - Store City
 - Store Location
 - Store Open Date

VISUALIZATION CHOICES AND DASHBOARD NAVIGATION

The vertical black slicer banner on the left allows users to filter the data. The first slicer contains the metrics Orders, Profit, and Revenue, updating the information displayed in the trend lines and in the Best Performing Stores charts.

The other three slicers allow users to filter data by time period (year, quarter, and month), store location type (airport, downtown, residential, or commercial), and store city. These filters update all charts simultaneously, with the exception of the Product Insights charts and the Stock charts, enabling users to explore relationships between metrics across specific cities, locations, and timeframes.

General KPIs section

At the top of the dashboard, just below the title banner, a set of card visuals highlights the key performance indicators: number of orders, revenue, profit, and average transaction value. These metrics provide a high-level snapshot that is essential for assessing both store and product performance.

Trends section

Below the General KPIs section, the Trends section presents two line charts. The top chart shows how Orders, Profit, and Revenue evolve over time, featuring a drill-down capability that allows users to explore data at more granular levels. This interaction not only updates the selected chart but also refreshes all other visuals in the dashboard, except for those in the Inventory Overview section, ensuring a consistent and highly interactive exploration experience.

Below it, the Moving Average (30 Days) chart displays the average daily values over time, calculated based on the previous thirty days (including zero-activity days), helping to smooth short-term fluctuations.

Stores' Performance section

To the right of the Trends section is the Stores' Performance area. At the top, a card visual displays the store age (when a single store is selected). This context is valuable for lifecycle analysis, fair benchmarking, and identifying best practices among stores at different stages of maturity.

Below it, a horizontal bar chart highlights the top five stores ranked by Orders, Profit, or Revenue. Clicking on any bar (representing a store) updates all dashboard visuals, enabling a more focused analysis of that specific store.

Inventory Overview section

Below the Stores' Performance section is the Inventory Overview section, which consists of three visuals.

The Current Stock card visual shows the total stock on hand, filtered to the stores currently selected. The Stock Coverage (Days) visual estimates how many days the current inventory will last based on the average daily sales over the last thirty days. The Stock Alert visual classifies inventory health based on stock coverage days, flagging items as Out of Stock, Critical, Low, or Good according to predefined coverage thresholds.

Product Performance Section

At the bottom of the dashboard, the Product Performance section focuses on product categories and individual items.

On the left, a horizontal bar chart displays Orders by product category. Drill-down functionality allows users to click into a category to view the performance of its specific products, which also updates all other visuals in the dashboard.

On the right, two bar charts highlight the five best-performing and five weakest-performing products based on the number of Orders. This makes it easy to quickly identify which products are driving sales and which may require attention.
